高级搜索树

伸展树:逐层伸展

我要一步一步往上爬 在最高点乘着叶片往前飞

局部性/Locality: 刚被访问过的数据,极有可能很快地再次被访问

❖ 这一现象在信息处理过程中屡见不鲜...

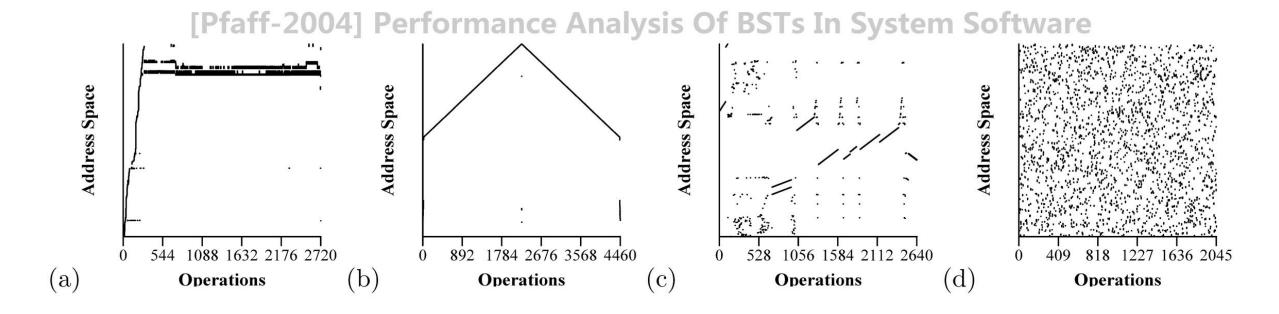

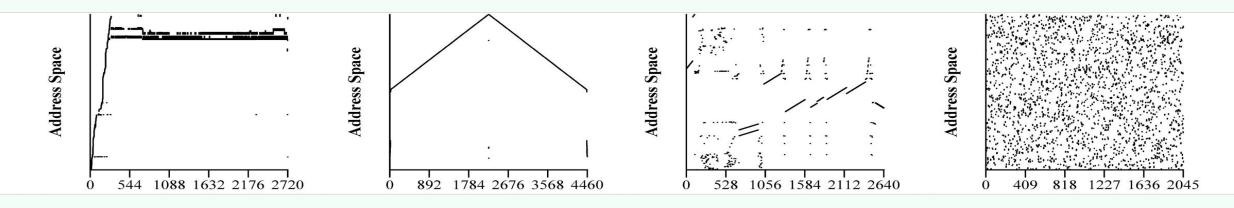

Figure 2: Call sequences in (a) Mozilla 1.0, (b) VMware GSX Server 2.0.1, (c) squid running under User-Mode Linux 2.4.18.48, and (d) random test sets. Part (b) omits one mmap-munmap pair for memory region 0x20000000 to 0x30000000 and (c) omits address space gaps; the others are complete.

BST的局部性

❖ 时间: 刚被访问过的节点, 极有可能很快地再次被访问

空间:下一将要访问的节点,极有可能就在刚被访问过节点的附近

* 对AVL连续的m次查找 (m >> n) , 共需 $\mathcal{O}(m \cdot \log n)$ 时间——能否利用局部性加速?

❖ 自适应链表: 节点一旦被访问, 随即移动到最前端

模仿: BST的节点一旦被访问, 随即调整到树根

❖ 难点: 如何实现这种调整? 调整过程自身的复杂度如何控制?

逐层伸展

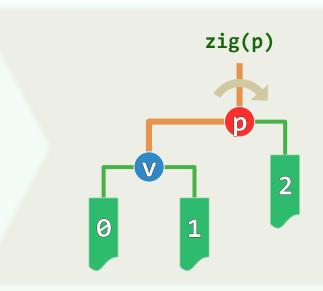

❖ 节点∨一旦被访问

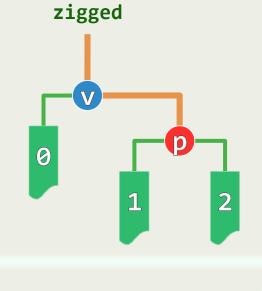

随即被推送至根

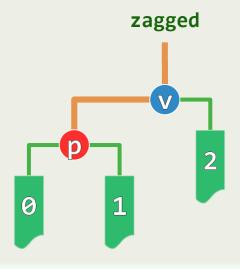

❖ 与其说"推",不如说"爬"

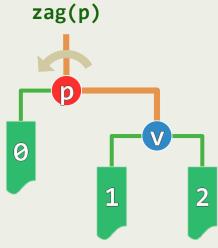

一步一步地往上爬

- ❖ 自下而上,逐层旋转
 - zig(v->parent)
 - zag(v->parent)

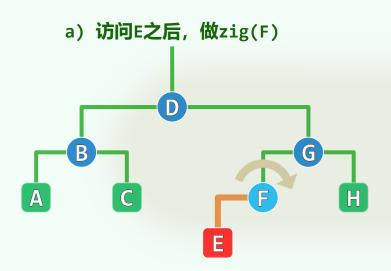

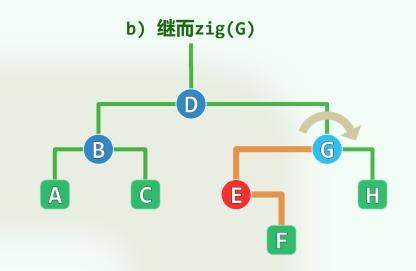

实例

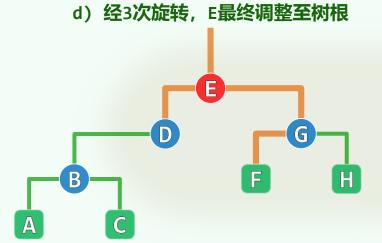

*** 伸展过程的效率**

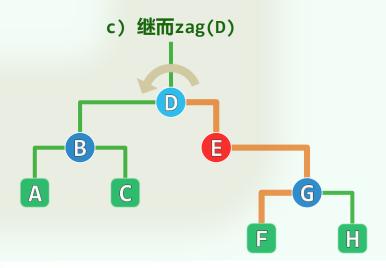

是否足够地高?

- ❖ 这取决于
 - 树的初始形态和
 - 节点的访问次序

最坏情况

❖ 旋转次数

呈周期性的算术级数

❖ 每一周期累计 $\Omega(n^2)$

分摊 $\Omega(n)$

❖ 怎么破?
